Summary page 78

This report talked about a new modern solution to authenticate by using our thoughts. While thinking about the password, an electroencephalogram, as know as EEG, will analyse our thoughts signals and compare them with the first initialization. If there's multiple user across, EGG can identify at 99% the brain waves of the owner.

Although, noise, electrical environment and user mental state can create issues and prevent recognition, Motorola announced electronic tattoos and sensors as alternative authentication. Furthermore, EGG will be miniaturized and be use on a more common way, such as Google Glasses.

I don't like this kink of technologies, research has proved that electromagnetic waves cause a lot of drawbacks on our body, even on the brain, so why we should bring this closer to/in our body. This technologies tend to bring more people to be a cough potato because they will be available to control everything with their mind. However, this could be help full for people with disease like mute people maybe, but for normal people i think it's useless.
